1 GCD Theorems

1.1 GCD WR

If a and b are integers not both zero, and q and r are integers such that $a = qb + r$, then $\gcd(a, b) = \gcd(b, r)$

1.2 GCD CT (GCD characterization theorem)

If d is a positive common divisor of the integers a and b, and there exist integers x and y so that $ax + by = d$,then $d = \gcd(a, b)$.

1.3 Coprimeness and Divisibility

If a,b, and c are integers and $c \mid ab$ and $\gcd(a, c) = 1$, then $c \mid b$

1.4 Primes and Divisibility

If p is a prime and $p \mid ab$ then $p \mid a$ or $p \mid b$

1.5 GCD of One

Let a and b be integers. Then $\gcd(a, b) = 1 \iff ax + by = 1$ where x and y are integers.

1.6 Division by the GCD

Let a and b be integers. If $\gcd(a, b) = d \neq 0$, then $\gcd(\frac{a}{d}, \frac{b}{d}) = 1$.

2 EEA

2.1 Extended Euclidean Algorithm

If $a > b > 0$ are positive integers, then $d = \gcd(a, b)$ can be computed and there exist integers x and y so that $ax + by = d$.

3 Linear Diophatine Equations

Equations with integer co-efficients for which integer solutions are sought.

3.1 Linear Diophatine Equation Theorem, Part 1 LDET1

Let gcd (a,b)=d. The linear Diophatine equation $ax + by = c$ has a solution iff $d \mid c$

3.2 Linear Diophatine Equation Theorem 2, LDET2

Let $\gcd(a, b) = d$ where both a and b are not zero. If $x = x_0$ and $y = y_0$ is one particular integer solution to the equation $ax+by = d$ then the complete solution is $x = x_0 + \frac{b}{d}n$, $y = y_0 - \frac{a}{d}n \forall \epsilon Z$

4 Congruence

Let m be a fixed positive integer. If $a, b \epsilon Z$ we say that a is congruent to b modulo m. $a \equiv b \mod m$ if $m \mid (a - b)$. If $m \nmid (a - b)$ then $a \neq \mod m$

4.1 Equivalence relation

1. $a \equiv b \mod m$
2. If $a \equiv b \mod m$ then $b \equiv a \mod m$
3. If $a \equiv b \mod m$ and $b \equiv c \mod m$ then $a \equiv c \mod m$

4.2 properties of congruence

1. $a + b \equiv a' + b' \mod m$
2. $a - b \equiv a' - b' \mod m$
3. $ab \equiv a'b' \mod m$

4.3 Congruences and Division

If $ac \equiv bc \mod m$ and $\gcd(c, m) = 1$ then $a \equiv b \mod m$

4.4 Congruent IFF Same remainder

$a \equiv bmodm$ iff a and b have the same remainder when divided by m.

4.5 Modular Arithmetic

4.5.1 Congruence class

$[a] = x \epsilon Z \mid x \equiv amodm$
Z_m is the set of m congruence classes. $[a] + [b] = [a + b]$ and $[a] * [b] = [a * b]$

4.5.2 Identity

Something that does nothing.
$\forall a \epsilon S, a * e = a$

4.5.3 Inverse

$a * b = b * a = e$ Subtraction is the addition of inverse. Division is multiplication with inverse.

4.6 Fermat's Little Theorem

If p is a prime number that does not divide the integer a, then $a^{p-1} \equiv 1 modp$
For any integer a and any prime p $a^p \equiv amodp$

4.6.1 Existence of Inverse

Let p be a prime. if $[a]$ is any non zero element in Z_p then there exists an element $[b] \epsilon Z_p$ so that $[a] * [b] = 1$

4.7 Linear Congruences

$ax \equiv cmodm$ is a linear congruence. solution if x so that congruence is true.

4.7.1 Linear congruence Theorem 1 LCT1

Let $gcd(a, m) = d \neq 0$ The linear congruence $ax \equiv cmodm$ has a solution iff $d \mid c$. Also if x_0 is a solution then complete solution is $x \equiv x_0 mod \frac{m}{d}$

4.7.2 Linear Congruence Theorem 2, LCT2

Let $gcd(a, m) = d \neq 0$. The equation $[a][c] = [c]$ in Z_m has a solution iff $d \mid c$

4.8 Chinese Remainder Theorem

Let $a_1, a_2 \epsilon Z$ If $gcd(m_1, m_2) = 1$ then the simultaneous linear congruences $n \equiv a_1 mod m_1$ and $n \equiv a_2 mod m_2$ have a unique solution modulo $m_1 m_2$ Thus is n=n_0 is one integer solution then the complete solution is $n \equiv n_0 mod m_1 m_2$

5 RSA

5.1 Setting up RSA

1. choose two large distinct primes p and q and let n=pq.
2. select an integer e so that $gcd(e, (p-1)(q-1)) = 1$ and $1 < e < (p-1)(q-1)$
3. solve $ed \equiv 1(mod(p-1)(q-1))$for an integer $1 < d < (p-1)(q-1)$
4. public key is (e,m) and private key is (d,n)

5.2 sending a message

1. look up public key(e,n)
2. generate an integer message M $0 \leq M < n$
3. compute the ciphertext C $M^e \equiv C mod n$ where $0 \leq C < n$

5.3 receiving a message

1. use the private key (d,n)
2. compute message text R from C $C^d \equiv R(mod n)$ where $0 \leq R < n$

6 Complex Numbers

Complex Numbers: An expression of the form $C = x + yi \mid x, y \epsilon R$ where x and y are real numbers. Has a real and imaginary part.

Mathematical operations$a+bi = c+di \leftrightarrow a = cb = d$ $(a+bi)+(c+di) = (a+c)+(b+d)i$ $(a+bi)(c+di) = (ac-bd)+(ad+bc)i$

1. Associativity of addition $(u + v) + z = u + (v + z)$
2. Commutativity of addition $(u + v) = v + u$
3. additive identity $0 + 0i$
4. Additive inverse $-z = -x - yi$
5. Associativity of multiplication $(u * v) * z = u * (v * z)$
6. Commutativity of multiplication $(u * v) = v * u$
7. multiplicative identity $1 = 1 + 0i$
8. multiplicative inverse $z = x + yi\frac{x-yi}{x^2+y^2}$

6.1 Complex conjugate

complex conjugate of $z = x + yi$ is $\overline{z} = x - y$

6.2 Modulus

Modulus of $z = x + yi$ $|z| = |x + yi| = \sqrt{x^2 + y^2}$

6.3 Polar multiplication of Complex Numbers

If $z_1 = r_1(cos\theta + isin\theta)$ and $z_2 = r_2(cos\theta + isin\theta)$ are two complex numbers in polar form then $z_1z_2 = r_1r_2(cos(\theta_1 + \theta_2) + isin(\theta_1 + \theta_2))$

6.4 De Moivre's Theorem

If $\theta\epsilon\mathbb{R}$ and $n\epsilon\mathbb{Z}$ then $(cos\theta + isin\theta)^n = cos(n\theta) + isin(n\theta)$
if $z = r(cos\theta + isin\theta)$ and n is an integer then $z^n = r^n(cos\theta + isin\theta)^n$

6.5 complex exponential function

$e^{i*\theta} = cos\theta + isin\theta$

6.6 Properties of Complex Exponentials

$e^{i\theta} * e^{i\phi} = e^{i(\theta+\phi)}$
$(e^{i\theta})^n = e^{in\theta}$

6.7 Complex n-th Roots Theorem

if $r(cos\theta + isin\theta)$ is in the polar form of a complex number a, then the solutions are $\sqrt[n]{r}(cos(\frac{\theta+2\pi k}{n}) + isin(\frac{\theta+2\pi k}{n}))$
